Programming Project 1-1 – Building Background [**10 pts**]

COMP7212 Operating/Distributed Systems

Due: 10/9/2026

Objective: To conduct the programming projects, students need to research the multi-threading and inter-process communication support of their preferred programming language. In this project, the students will perform an independent study on these features of their programming language to prepare for upcoming programming projects.

Task 1. Choosing a Programming Language

Decide which programming language you will use for implementing the class projects throughout this course.

Task 2. Brief Research on Thread Library [5 pts]

Review the thread library of your programming language. Learn how to write a simple multi-threaded application using the programming language. Write a one-page summary on how to implement a multi-threaded application using the thread library of your programming language.

Task 3. Reviewing the Inter-Process Communication Methods [5 pts]

Review the inter-process communication method (e.g., sockets) supported by your programming language. Learn how the message-based inter-process communication can be implemented using your programming language. Write a one-page summary on how to implement a simple application based on the message-oriented inter-process communication method supported by your programming language.

File(s) to submit

- Your two-page report.
